

Hierarchies are designed for organizations with 100+ vehicles (**Enterprise** feature). Hierarchies allow you to organize your fleet using multiple branches based on function, organizational structure, geographic region, or other customer-defined methodology. This level of organization through hierarchies provides the following benefits:

- **Scalable Administration** – Segment your account by different divisions within the organization.
- **Permission-Based User Access** – Allow division managers to administer their own vehicles, users, and drivers for certain nodes/branches and even manage the lower levels of the hierarchy structure itself.
- **Custom Reports** – Design reports that include/exclude/intersect multiple trees without having to manually create groups for every combination of interest.
- **Report Distribution and Alert Escalation** – Apply attributes to hierarchies to manage alerts, timezones, and scheduled report recipients.
- **Quick Queries** – More intuitively filter data on reports, maps, and dashlets by node/branch. (See below.)

Note. In order to use Hierarchy, your account must have the Manage Hierarchy item enabled in the **Menu Access List** (Account category). Additionally, different members in your organization can have different permissions to view and/or edit different branches within hierarchies. See **Hierarchy Access** to learn more.

Once one or more hierarchy trees are in place, users with permissions to see the branches can use them on reports, alerts, and more:
